

Siburan Resources

Siburan Resources discovers new gold zone at Mt Pleasant

Monday, March 21 2011

Siburan Resources (ASX: SBU) has identified a very promising gold zone from auger geochemical sampling at the Mt Pleasant gold project, in the area of reconnaissance rock chip sampling which returned 7.86 grams per tonne (g/t) gold.

Adding to the prospectivity of the area is the recently discovered rotary air blast intersection of 4 metres at 3.93 g/t gold.

Importantly, the immediate area to the company's 15 prospecting licences has historically produced 6 million ounces of gold.

The latest anomalous zone identified is 130 metres by 80 metres, with the exploration program focused on extending the strike length.

Siburan said this mineralisation may be associated with the north-eastern extension of the Central Corridor which holds the historically defined Fidelatas prospect.

Noel Ong, managing director, said "The soil geochemistry gold anomaly outlined to the north-east of Fidelatas supports Siburan Resources viewpoint that the Mt Pleasant project remains highly prospective.

"This newly outlined gold anomalous zone possibly represents the northerly extension of the Central Corridor with historical drilling returning gold intercepts of 6 metres at 16.32g/t gold, 1 metre at 27.45g/t gold and 2 metres at 3.45g/t gold.

"I believe that a new systematic project wide soil auger geochemical sampling will outline additional gold anomalies which have the potential for a new significant gold deposit discovery."

The Mt Pleasant project is strategically located near infrastructure being just 40 kilometres from Kalgoorlie, and within the Broad Arrow Mineral Field.

Siburan continues to push the project forward at pace, by completing wide soil auger geochemical drilling by the end of this month.

Rotary air blast drilling programs will also test the Central Corridor to the north-east of Fidelatas, with infill and extension drilling at the Southern Corridor.
